VULCANISATION

Vulcanisation is a process of cross-linking of polymer in natural and synthetic rubber. It was discovered by Goodyear in 1839. He used sulphur molecule to crosslink polyisoprene in natural rubber. Vulcanisation process is largely used in rubber technology. This process is involved as follows:

(a) Vulcanisation by sulphur

(b) Vulcanisation by benzoyl peroxide: Benzoyl peroxide is used to vulcanised silicon rubber through a free-radical mechanism as:

(c) Vulcanisation by zinc Oxide: Zinc oxide involves in vulcanisation of polymer molecule as given below:

(d) Vulcanisation by S2Cl2: Such type of cross-linking takes place as:

sation by
$$S_2Cl_2$$
: Such type of cross-linking takes place a characteristic CH_2 and CH_2 are constant and CH_2 and CH_2 and CH_2 and CH_2 are constant and CH_2 and CH_2 and CH_2 and CH_2 and CH_2 are constant and CH_2 and CH_2 and CH_2 are constant and CH_2 are const
